The evolution of national systems of innovation in agriculture and resulting prospects for Sub-Sahara Africa: Lessons learned

Nicole Rippin

d·**i**·**e** Deutsches Institut für Entwicklungspolitik

1 Introduction

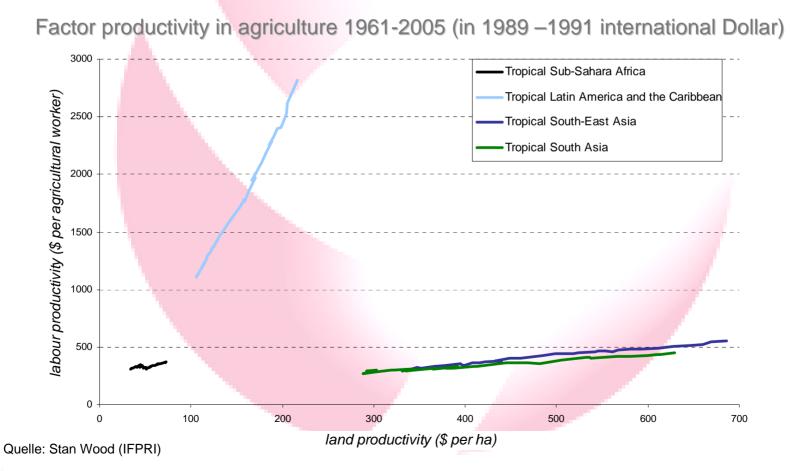

- 1.1 The Agricultural Sector in Africa: Facts and figures
- About 56% of Africans depend on agriculture for their livelihoods
- The modernisation of the agricultural sector is believed to be a crucial precondition for the modernisation of the African economy as a whole
- Agricultural productivity: A 10% increase in crop yields may deliver 6-10% people from extreme poverty
- Africa is the only region in the world where agricultural production per capita has declined over the past 40 years: Total food production increases annually at about 2%, population at about 3%

2.1 The Top-Down Model

d-i-e

Entwicklungspolitik 2 National Systems of Innovation

2.2 Case Study AGRAN*

- 1992: Start reform process of Benin's NARS with the creation of the NARI INRAB
- Since 1999 the GTZ project AGRAN assists the transition process of INRAB to a performing public enterprise for technology development coordinating all agricultural research activities in Benin. AGRAN is supported by Dutch and Danish Cooperation
- Integration of AGRAN in the bilateral sector program ProCGRN (conservation and management of natural resources) in 01/2004

Entwicklungspolitik 2 National Systems of Innovation

2.3.1 Lessons Learned: The role of the national government

Weak point(s):

- Responsibility of government for all agricultural research

Lessons learned:

- Privatisation or joint funding whenever public good character is weak
- Introduction and implementation of IPR
- In general: basic research more insecure than applied research hence more likely public responsibility

d_ie

Entwicklungspolitik 2 National Systems of Innovation

2.3.2 Lessons Learned: Management of financial resources

Weak point(s):

- Main financial instrument: Block grants (input-oriented), irregular disbursement

Lessons learned:

- Introduction of distinct financial instruments:
 - Push-intervention for basic research: regularly disbursement (e.g. block grants)
 - Pull-intervention for specific desired technologies: disbursement dependent on achievement of pre-specified criteria (e.g. competitive research funds)
- Introduction of efficient fiscal management: e.g. AGRAN introduced regularly financial reports and established analytical accounting

d·1·e

Entwicklungspolitik 2 National Systems of Innovation

2.3.3 Lessons Learned: Responsibilities and networks Weak point(s):

- Separation of knowledge generators and users (Top-Down approach): Little involvement of stakeholders in R&D-activities
- Weak linkages to other research organisations (e.g. NGOs, FBOs, CBOs)
- Centralisation of R&D in headquarters of congested urban areas

Lessons learned:

- Participation of all stakeholders in R&D (funding, priority setting, conducting research, dissemination, M&E): e.g. AGRANs management cycle
- Establishing partnerships and linkages to other research organisations: e.g. AGRANs concept for demand-driven agricultural research
- Decentralisation: national for basic, local for applied research: e.g. AGRANs concept for demand-driven agricultural research

d-i-e

Entwicklungspolitik 2 National Systems of Innovation

2.3.3 Responsibilities and networks: Management cycle

Key constituents:

- Priority setting in collaboration with FBOs
- Peer review of inter-institutional research proposals
- Evaluation of research results
- Publications & decision making for transfer to extension

Management cycles proved extraordinarily effective in:

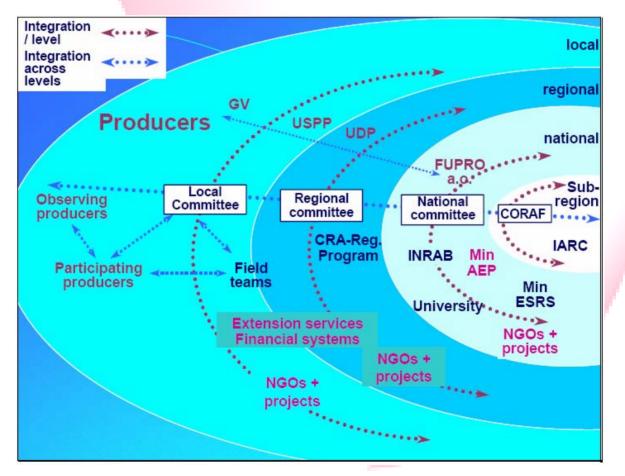

- Focussing research on needs of resource poor farmers
- Improving scientific quality & efficiency of technology development
- Fostering networking between governmental & non-governmental service providers & producer organizations
- Generating performing & mainly bankable information relevant for extension & credit
